N, n, 1 en; 2 *en*, *n*. [PNS, N's, or Ns, 1 en; 2 *en*, *pl.*] **1.** A letter: the fourteenth in the English alphabet. It is best called the "dental (or lingual) nasal." Its sound is made by bringing the end of the tongue into contact with the upper teeth or adjacent gum, and sending the speech-current through the nose while the vocal cords are vibrating. The sound of *d* is made in the same way, except that the nasal passage is closed. In sounding *np* (as in *snip*), which is not a compound combination of *n* and *p*, the nasal passage is open, but the closure is made with the back part of the tongue; hence the name "guttural nasal." (See under *G*.)

In Latin and Greek the final *n* of a prefix was freely assimilated to a following consonant: *impel* for *in-pel*, *collect* for *con-lect*, *sympathy* for *syn-pathy*. In English, such an *n* is more stable; cf. *un-pack*, *un-load*. In a few words of Latin origin *n* is silent after *m*, as in *solemn, damn*. A small group of Germanic words have lost an original *n* before a spirant; e. g., *other, goose, soft* (cf. German *ander, gans, sanft*). Before *ch* and *j*, as in *inch, vine*, there is a slight modification of *n*, which our spelling ignores.

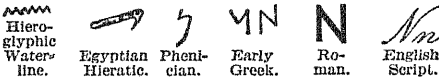

Before *h*, as in *tnk*, *n* becomes *ng*. For French *n* denoting nasality of the preceding vowel, see under *M*. Like *l*, *m*, and *r* (see under *I*), *n* may form a syllable. "Syllabic *n*" derives generally from the reduction of unaccented *-an, -en, -on*, through an as an intermediate stage, to a faint vocal murmur; cf. *Satan, given, agent, cotton*. Phoneticians denote the sound by *n*, *ñ*, or the like. In this Dictionary simple *n* is used for the weakest stage of the vocal murmur, as for those less weak: *lis'n, ket'n, ür'bän*.

The lingual dental *n* is the most frequent of the nasals, and next to the most frequent of all the letters, averaging 6.76 per cent. of the letters on the pages of English literature as examined by W. D. Whitney. The corresponding figure for the guttural nasal, denoted in key 1 by *ñ*, is 7.9 per cent. It does not occur initially. See *WITNEY Oriental and Linguistic Studies* second series, p. 274.

The sign *n* is used in the respelling of foreign words, especially in French, to indicate that the preceding vowel has nasal resonance. But in Chinese words such nasality is indicated by the familiar *ng*.

Capital *N* is from Latin, Greek *N* < Early Greek, Latin *N* < Phoenician *𐤍* < hieratic *𐩌* < hieroglyph *𓏲*. The hieroglyph is a water-line, the Phoenician name is *nun*, a fish, whence Greek *νῦν*; from Latin *en* comes the English name. The Anglo-Saxon letter was *f*, named *nēd*, need, the 10th in the futhorc; *ŋ*, *ng*, *ſ*, called *ing*, is the 22d. For lower case, black letter, dates, and the like, see *A*.

sea"; the idea that an *epithet* is always opprobrious, and that any word used opprobriously is an *epithet*, is a popular error. *Designation* may be used much in the sense of *appellation*, but is far broader and more general in meaning; a *designation* properly so called rests upon some inherent quality, while an *appellation* may be fanciful. One's personal name, as John or Mary, is given in infancy, and is often called the given name or Christian name, or simply the first name. The cognomen or surname is the family name which belongs to one by right of birth or marriage. Among the Romans the *praenomen* was the individual part of a man's name, the *nomen* designated the gens to which he belonged, the *cognomen* showed his family and was borne by all patri- cians, and the *agnomen* was added to refer to his achieve- ments or character. When scientists name an animal or a plant, they give it a binary or binomial technical name com- prising a generic and a specific *appellation*. In modern use, style is the legal *designation* by which a person or house is known in official or business relations; as, the name and style of Baring Brothers. The term *denomination* is applied to a separate religious organization, without the opprobrious meaning attaching to the word *sect*. The term is used also to designate any class of like objects collectively, especially money or notes of a certain value; as, the sum was in notes of the denomination of one thousand dollars.—by the name of, known or designated as; called; as, a man by the name of Jones.—for one's name's sake, see SAKES.—n., in title or address; as, a father only in name.—in the n. of, 1. naph'tha, 1 *naph'tha* or *naph'tha*; 2 *naph'tha* or *naph'tha*, *n.* [*XIII*] A light, colorless, volatile, inflammable oil distilled from organic bodies, as bituminous shale, asphalt minerals, etc., but principally from petroleum, having an average specific gravity of .885, used as a solvent, as in the manufacture of paints, varnishes, etc., and as a burning-fluid for illumination, fuel for motors, etc.

Originally naphtha was the more volatile constituent of asphalt and bitumen, and was known to the ancient Egyptians, who used it in their perpetual lamps. With the growth of chemistry the name was applied to a number of volatile, mobile, strong-smelling inflammable liquids, chiefly ethers, as *naphtha vitrioli* (sulfuric ether), and at present it is sometimes loosely applied to any liquid hydrocarbon, natural petroleum, or some of its volatile products.

Some varieties of naphtha are named from the substance from which they are derived; as, *caoutchouc-naphtha* (obtained by the dry distillation of crude india-rubber), *coal-n.* (distilled from rich bituminous coals, as albertite or grahamite), *coal-tar n.* (the volatile mixture distilled from coal-tar, containing benzene, toluene, xylene, and similar hydrocarbons), *mineral n.* (same as *PETROLEUM*), *petroleum n.* (the more volatile portion of petroleum, which is collected separately during the distillation, and sold as *crude naphtha*, or again separated by distillation into gasoline, refined naphtha, and benzene), *shale-n.* (distilled from bituminous shales or schists), *wood-n.* (same as *METHYL ALCOHOL*).

Pliny mentions the oil of a spring at Agrigentum, Sicily, and states that it was collected and used for burning in lamps, as a substitute for oil. He distinguishes this oil from *naphtha*, which he says was too light and inflammable for such a use. Of *naphtha*, he mentions a locality in *Parthia* (about the sources of the Indus).

The sum of qualities or attributes which characterize an individual or species as different from other individuals or species; the character, constitution, or essential traits of a person, thing, or class, especially if original rather than acquired. Hence, the sum of native attributes or conditions, as opposed (1) to cultivation, domestication, civilization, as a state of nature; or (2) to that which is artificial, sophisticated, insincere, unnatural, as in the phrases *following nature*, *back to nature*, etc.

For if thou wast cut out of that which is by nature a wild olive tree and wast grafted contrary to nature into a good olive tree: how much more shall these, which are the natural branches, be grafted into their own olive tree? *Rom. xi. 24* (R. V.). *Art is the child of nature.* *Lonsdale's Keramos* st. 29. 2. The physical or psychical constitution or character of persons or things, whether native or acquired, regarded as having some sort of unity, or causative energy and being a source of changing effects: often personified in poetry or figurative prose; as, the call of *nature*; the dictates of *nature*; *nature* fails at last.

Nature is awe to him. *Had diff' for candy trim.* With her great Master so to sympathize. *Milton On the Morning of Christ's Nativity* Hymn, st. 1. 3. A collective abstract term for the entire universe, and embracing all its existences, forces, and laws, regarded as constituting a system or unity which may be covered, however vaguely, by one conception and designated by a single term. In this meaning, however, we are obliged to recognize an attempt to blend two aspects or ways of regarding the universe which are more or less distinctly different, while both are necessary. These are: (1) The system of things and persons regarded as actually existent in space and time; the world of material and mental or spiritual beings; creation as product; the universe as apparent to sense-perception or inferable on a basis of sense-perception. (2) The molding or creative forces; the powers which account for the origins and changes of things, and for the production and evolution of the world, in accordance with some observable or purely conjectural plan or controlling ideas; as productive energy. This antithesis or contrast between the passive and active conception of nature, the aspect of the universe as created, and that of the same universe as perpetually self-creating, is very old. Plato emphasized it by distinguishing the material principle from the formal principle in nature. Aristotle introduced the conception of God as moving cause in distinction from Nature as the moved physical universe. Spinoza regarded *natura naturans* and *natura naturata* as aspects or elements of the one universal substance. Modern science attempts to unite in a more vital way the two conceptions of nature, but can not abolish or even successfully conceal the importance of the distinction.

4. The system of natural existences, forces, changes, and events, regarded as distinguished from, or exclusive of, the supernatural; the total of creation considered as apart from, or contrasted with, a Creator; as, God is the author of *nature*. 5. The sum of physical or material existences and forces, regarded as exclusive of man, and so offered to him as an object of research, use, sympathy, conflict, or, more especially, moral opposition; as, the study of *nature*; the struggle with *nature*.

Then, in mankind's fair youth, — so our musings run — mutual understanding brought Nature nigh to Mind. *I. I. Lotze Microcosmus* tr. by Hamilton and Jones, vol. i, p. 1. [c. & r. c. 1885.] 6. Hence, the constitution or inherited or habitual condition and tendencies of man, the individual or the race, regarded as something inferior or antagonistic to spiritual existence and development; the human native condition as one to be transcended, improved, or converted; especially, in theology, the unregenerate state; the character as unchanged by divine grace; as, by *nature* children of wrath.

It was amplified and reenacted in 1672 and required that the ships not only be English but be manned by crews at least three-fourths English. Syn.: clean, cleanly, dapper, natty, nice, orderly, prim, spruce, tidy, trim. That which is clean is simply free from soil or defilement of any kind. Things are orderly when in due relation to other things; a room or desk is orderly when every article is in place; a person is orderly who habitually keeps things in order. Tidy denotes that which conforms to propriety in general; an unlaced shoe may be perfectly clean, but is not tidy. Neat refers to that which is clean and tidy, with nothing superfluous, conspicuous, or showy, as when we speak of plain but neat attire; the same idea of freedom from the superfluous appears in the phrases "a neat speech," "a neat turn," "a neat reply," etc. A clean cut has no ragged edges; a neat stroke just does what is intended. Nice is stronger than neat, implying value and beauty; a cheap, coarse dress may be perfectly neat, but would not be termed nice. Spruce is applied to the show and affectation of neatness with a touch of smartness, and is always a term of mild contempt; as, a spruce serving-man. Trim denotes a certain shapely and elegant firmness, often with suppleness and grace; as, a trim suit; a trim figure. Prim applies to a precise, formal, affected nicety. Dapper is spruce with the suggestion of smallness and slightness; natty, a diminutive of neat, suggests minute elegance, with a tendency toward the exquisite; as, a dapper little fellow in a natty business suit.

It was indefinitely conceived by Swedenborg, more clearly outlined by Kant, Herschel, and Laplace (in his *Système du Monde*), expanded as one of the general processes of evolution by Herbert Spencer, brought down to the basis of a physical theory by George Howard Darwin, and is the subject of interesting theories advanced by Thomas Chamberlin and others.

The nebular hypothesis requires us to admit that all the ponderable material now constituting the various bodies of the solar system once extended in a rarefied or nebulous and rotating condition, beyond the confines of the nearest distant nebulae. Indispensably requisite or absolutely needed to accomplish a desired result; requisite; as, health is necessary to the best work. Syn.: essential, indispensable, inevitable, needed, needful, required, requisite, unavoidable, undeniable. That which is essential belongs to the essence of a thing, so that the thing can not exist in its completeness without it; that which is indispensable may be only an adjunct, but it is one that can not be spared; vigorous health is essential to an arctic explorer; warm clothing is indispensable. That which is requisite (or required) is so in the judgment of the person requiring it, but not absolutely; thus the requisite is more a matter of personal feeling than the indispensable. Inevitable and unavoidable are applied to things which some at least would escape or prevent, while that which is necessary may meet with no objection; food is necessary, death is inevitable; a necessary conclusion satisfies a thinker; an inevitable conclusion silences opposition. Needed and needful are more concrete than necessary, and respect an end to be attained, while necessary may apply simply to what exists; we speak of a necessary inference; necessary food is what one can not live without, while needful food is that without which he can not enjoy comfort, health, and strength.—Ant.: casual, contingent, needless, non-essential, optional, unnecessary, useless, worthless.—Freq.: necessary to a sequence or a total; for or to a result or a person; unity is necessary to (to constitute) completeness; decision is necessary for command, or for a commander.—necessary being, one whose non-existence is inconceivable or impossible; God.—n. proposition, a statement which is intrinsically undeniable.—nece's-sa'ri-ly, adv.—nece's-sa'ri-ness, n.

Syn.: compulsion, destiny, emergency, essential, exigency, extremity, fatality, fate, indispensability, indispensableness, need, requirement, requisite, sine qua non, unavoidable-ness, urgency, want. An *essential* is something, as a quality, or element, that belongs to the essence of something else so as to be inseparable from it in its normal condition, or in any complete idea or statement of it. *Need* and *want* always imply a lack; *necessity* may be used in this sense, but in the higher philosophical sense *necessity* simply denotes the exclusion of any alternative either in thought or fact; right-nessness is a *necessity* (not a *need*) of the divine nature. *Need* suggests the possibility of supplying the deficiency which *want* expresses; to speak of a person's *want* of decision merely points out a weakness in his character; to say that he has *need* of decision implies that he can exercise or attain it. As applied to a deficiency, *necessity* is more imperative than *need*; a weary person is in *need* of rest; when rest becomes a *necessity* he has no choice but to stop work. See PREDESTINATION. Compare synonyms for NECESSARY.—*Ant.*: choice, contingency, doubt, doubtfulness, dubiousness, fortuity, freedom, option, possibility, uncertainty.—*Prep.*: the necessity of surrender; a necessity for action; this is a necessity to me.

This may be either *absolute n.*, when it can not be prevented without involving contradiction, or *n. secundum quid*, when it would inevitably happen but for an external impediment or preventive cause.—*legal n.*, a necessity (1) constrained by law; (2) used in exonerating an otherwise unlawful act, as killing in self-defense; (3) justified by the demands of public welfare.—*logical n.* 1. Necessity in general as resulting from the nature, conditions, or relations of things, by reason of which a thing can not be conceived different from what it is. 2. More strictly, necessity involved in the very form of a statement or terms of a proposition.—*mathematical n.*, the inevitable connection or relationship established by mathematical laws between numbers or quantities.—*metaphysical n.*, the necessary connection between the essential elements of any metaphysical whole or entity.—*moral n.* 1. A neglected state. -*neg-lect*'-er, n. **neg-lect**'-ful, n. -*neg-lect*'-ing-ly, adv. With neglect; heedlessly; neglectfully.

neg-lect, n. 1. The act of neglecting. Specif.: (1) Omission to do something that should be done; oversight. (2) Omission to pay due attention or civility; slight; disregard. 2. The state of being neglected.

Everything wears the aspect of neglect and consequent decay. E. ROBINSON *Biblical Researches* p. 6. [c. a. 1856.]

3. Habitual want of regard; negligence; as, age breeds *neglect*. [*< L. neglegit*, < *neglegit*, pp.; see *NEGLECT*, v.] **neg-lect**'-ment, n. Syn.: carelessness, default, disregard, failure, heedlessness, inadvertence, inattention, indifference, neglectfulness, negligence, oversight, remissness, slackness, slight. *Neglect* is the failing to take such care, show such attention, pay such courtesy, etc., as may be rightfully or reasonably expected. *Negligence*, which is the same in origin, may be used in almost the same sense, but with a slighter force, as when Whittier speaks of "the *negligence* which friendship loves"; but *negligence* is often used to denote the quality or trait of character of which the act is a manifestation, or to denote the habit of neglecting that which ought to be done. *Neglect* is transitive, *negligence* is intransitive; we speak of *neglect* of his books, friends, or duties, in which cases we could not use *negligence*; *negligence* in dress implies want of care as to its arrangement, tidiness, etc.; *neglect* of one's garments would imply leaving them exposed to defacement or injury, as by dust, moths, etc. *Neglect* has a passive sense which *negligence* has not; the child was suffering from *neglect*, i. e., from being neglected by others; the child was suffering from *negligence* would imply that he himself was neglectful. The distinction sometimes made that *neglect* denotes the act, and *negligence* the habit, is but partially true; one may be guilty of habitual *neglect* of duty; the wife may suffer from her husband's constant *neglect*, while the *negligence* which causes a railroad accident may be that of a moment, and on the part of one ordinarily careful and attentive; in such cases the law provides punishment for criminal *negligence*. For the trait of character we say *negligence* rather than *neglect*. -*Ant.*: see synonyms for *ASSIDUITY*; *ATTENTION*; *CARE*. -*Prep.*: neglect of duty; of the child by the parent; neglect on the part of the teacher.

2. Easily disturbed or agitated, owing to weak nerves; excitable; timid; as, a *nervous* old man. 3. Abounding

in nerve-centers and terminal organs, as considered collectively, forming the highly specialized complex of structures and their associated parts which regulate and determine muscular and organic action and give rise to the various forms of consciousness. It is made up of nerve-cells or ganglia with the conducting nerves or branches dependent upon them. In practically all animals the original source of the nervous system is the ectoderm. In the higher vertebrates, as man, it is usually divided into three systems: (1) the central or cerebrospinal, consisting of the brain and the spinal cord; (2) the peripheral, consisting of the cranial and spinal nerves, the former including the nerves of special sense and those of the head and upper part of the body, the latter comprising the nerves of the trunk and limbs; and (3) the sympathetic. See under SYMPATHETIC. The cerebrospinal system has its origin in the embryo as a groove along the median dorsal line of the epiblast, the medullary groove, soon becoming a tube, the medullary tube, by the arching over and growing together of its lateral edges, and disappearing beneath the surface of the body, the lower end becoming the spinal cord and the upper end developing three enlargements or modifications, the cerebral vesicles, from which the brain of the adult is derived. The origin of the peripheral nerves is from outgrowths of the medullary tube or from ganglia forming originally a part of the walls of the medullary groove. The origin of the sympathetic nerve is somewhat obscure, but it is generally considered to be formed from cells that have migrated from the spinal ganglia or from the spinal cord. In all animals the brain and the spinal cord form the dominant portion of the nervous system, especially in man, in whom the automatic reflexes are considerably less than in any other creature; even in man, however, there remain many independent centers which contribute automatic impulses to certain muscular groups, as the smooth muscle-fibers supplied by the branches of the sympathetic nerve, whose action is involuntary. In invertebrates the nervous system may consist of a ring or series of rings, or, in certain elongated forms, of a cerebral ganglion, or rudimentary brain, from which two cords extend throughout the length of the body. These cords, which are usually ventral, are provided with nodules and connecting bands of nervous tissue at certain intervals. More specifically, the philosophical tenet, whether critical or dogmatic, which unwarrantably limits the "transubjective reference" of man's cognitive powers and denies their ability to attain certain knowledge of noumena or reality. This denial may take different forms and extend all the way from the avowal that nothing is knowable about such real beings as God, or such subjects as the freedom and immortality of the soul, to the refusal to credit any evidence for reality beyond the object given to the senses or to self-consciousness in the momentary act of knowing. In the controversy on this point they were represented as holding that Christ had two persons: the divine Logos, indwelling in the man Jesus, but not being an essential part of him as man; the union between the two elements, the divine and the mortal, being one of operation but not of substance; moreover, the sayings of Scripture about Christ are to be appropriated, some to the man and some to the Logos. neu'ron, 1 *nü'rön*; 2 *nü'rön*, *n. Anat.* 1. One of the essential structural units of the nervous system; a nerve-cell with all its processes and extensions. The neurons are associated together to form the organs of the nervous system, and are supported by a peculiar type of connective tissue called **neuroglia**. Each adult neuron consists essentially of a cell-body, with two kinds of processes (the **axis-cylinder** and the **dendritic**) issuing from it. The cell-body itself is formed of a mass of protoplasm enclosing a nucleus. It is generally believed that each neuron is an independent anatomical unit, capable of living and dying without reference to any other, and having its branches contiguous to but not continuous with those of the adjacent neurons. Compare **NERVE-CELL**; **NERVOUS SYSTEM**.
 It thus comes about that the nervous system is made up of an infinite number of **neurons**, bound up by connective tissue into various bundles and tracts according to the different kinds of impulses they conduct. There are . . . special bundles for motor impulses—the motor tract—and others for sensory impulses—the sensory tract—and so on, but the ultimate elements making up all these bundles are simple **neurons**. —**Nicene Creed (Ecc.),** a confession of faith adopted at the council of Nicæa, A. D. 325, as a settlement of a controversy concerning the persons of the Trinity. It was intended to cover debated questions as to the divinity of Christ, and it introduced the word *homoousian* to correct the error of the *homoiousian* party, and to it were added several minatory clauses concerning Arianism. The creed that is popularly known as the Nicene Creed is more properly called the *Niceno-Constantinopolitan* or *Constantinopolitan Creed*, a profession of faith based on an ancient Jerusalem creed, made under the influence of Cyril of Jerusalem (351-386) and edited in a Nicene sense; it is contained in the *Ancient Creed* of Epiphanius of Salamis (373-374), and is traditionally but erroneously attributed to the Council of Constantinople (381). Of the 178 words in the original only 33 are positively taken from the creed of A. D. 325. It is received as ecumenical by the Eastern and Roman communions and by the majority of the Reformed churches. At the Council of Toledo, A. D. 589, the Western Church added the Filioque clause, the preposition *in* before the words "holy Catholic and Apostolic Church," and employs the singular form of the words used for expressing assent, "I believe," "I hope," "I confess." In the *Book of Common Prayer* the preposition *in* is omitted, and by an accident the word *holy* does not appear as an epithet of the church. See FALLOUT.

stationary points found in a vibrating medium, especially of one dimension, as a string. A string, as of a violin if plucked or bowed vibrates as a whole, with nodes at its extremities, and produces its fundamental tone. If lightly stopped at the middle point in its length, an additional node will be formed at that point, and the note produced will be an octave above the first. If it be stopped one-third of its length from either extremity, nodes will be formed at the points of trisection, dotted loops; 1, a ventral segment; and the resulting note A, B, C, D, E, F. If *AB* equals one, the octave. Similar nodes then *AC* equals two, *AD* equals also formed in the three, etc.

A system of names, or of naming, applied to the subjects of study in any art or science, especially in botany and zoology. Cessalpin in 1582 and Tournefort in 1700 published systems of classification, but the basis of our present nomenclature, called the binomial (two-name) system, was laid by Linnaeus in his *Species Plantarum* (1753). Each species is given two names, Latin or Greek, the first name indicating the genus to which the species belongs, and the second the species-name, as *Betula papyrifera*. The species-name begins always with a small letter, as *Panicum americanum*. Subspecies, varieties, and forms, all considered of lower categorical value than species, have trinomial appellations, as *Betula papyrifera minor*. Duplication of names is avoided. In disputed cases priority of publication is the determining criterion. *Habenaria flava* (L.) A. Gray indicates that Linnaeus (L.) referred this species to the wrong genus and A. Gray made the needed correction. *Amaranthus bioloides* S. Watson shows that S. Watson is the author of the binomial. The terminations -*ides* and -*aces* are used in family-names in zoology and botany, respectively, as *Feldia*, the cat family; *Beidaceae*, the birch family. Botanical order-names end in -*ales*, as *Fagales*. Orders in zoology and groups of higher standing categorically, as subclasses, classes, divisions, and phyla, have no formally adopted name-terminations.

2. An alphabetical or systematic list of technical names. Compare TERMINOLOGY.

The technical nomenclature of a single science, when finished and arranged, is a transcript of all the discriminating thoughts, and the manifold experiments by which the science has been formed. POUSSIN *Human Intellect* § 393. [S. 1868.]

nor, 1 nör; 2 nör, *conj.* 1. And not; likewise not. *Nor* is used: (1) Most commonly, as a correlative of a preceding negative, usually *neither* or *not*, which is sometimes omitted for poetical or rhetorical effect; as, he eats *neither* butter *nor* cheese, he did *not* speak, *nor* did he move; friend *nor* foe could stop him. Let us hope that our dead have at last found that rest which *neither* summer *nor* winter, *nor* day *nor* night, had granted to their unending earthly labors! *Holmes Medical Essays* p. 174. [L. M. & Co. 1883.]

(2) Without a correlative; as, we sat still, *nor* stirred. (3) In older writers, and in poetry, as an introductory negative instead of *neither*; as, he hee le.1 *nor* praise *nor* blame. Discriminate between *nor* and *or* when used after *no* or *not*. "He has no money *nor* credit"; here "credit" is only an equivalent of "money" and serves merely to amplify expression. "He has no money *nor* credit" presents "credit" as an important alternative, an additional resource. In less simple statements the distinction may be of much importance. "Will or disposition," "power or faculty," may be but pairs of synonyms. The locution "will *nor* disposition," "power *nor* faculty," distinguishes the two members of a pair as different.

after the Conquest, when it became merged little by little in Normandy into the Norman type of French Pointed, and in England into the kindred but inferior Early English style. The French and the oldest English examples differ but little from those of other contemporaneous Romanesque styles, leading characteristics being the round arch and barrel vault and massiveness of construction. The later tendency of the style in England exhibits a certain degeneracy, as to the preference of wooden roofs to vaulting and the persistence of certain rather rude types of moldings, as the dog-tooth, the many English buildings in this style are very rich and impressive in effect. Castles almost innumerable were built in this style in both Normandy and England. See ENGLISH ARCHITECTURE, under ENGLISH, and also ILLUS. above.—**N. Conquest**, same as THE CONQUEST.—**N. or process of noting or designating by figures or other marks; as, the notation of time. 2. Any system of signs, figures, or abbreviations employed for convenience in the discussion of any science or art, especially arithmetical and algebraic characters; as, musical, chemical, or logical notation.

Indeed, the reason of our on decimal notation, why we reckon by tens instead of the ancient twelve, appears to be that our forefathers got from their own fingers the habit of counting by tens.

E. B. TYLOR *Anthropology* p. 18. [A. 1881.]

See note and table below. 3. Chess. A method of writing moves in chess, expressed in abbreviations. See CHESS, n. 4. Etymological meaning. 5. [Rare.] An annotation; note. 6. [Rare.] The act of making a note of anything. [*L. notatio(n)-, < nota; see NOTE, n.*]

The arithmetical notations now in use are the Arabic, employing the nine digits and the cipher (1, 2, 3, 4, 5, 6, 7, 8, 9), which were introduced from an Arabic work into Europe in the 12th century, and the Roman, using letters of the alphabet. The former is universally employed in calculation, because it is based on the decimal system. In it the value of any symbol depends on its place—that is, on the number of symbols to the right—the ordinal value being multiplied by a power of ten whose exponent equals this number. In the Roman notation, when the symbol of a smaller number precedes that of a larger it denotes subtraction; when it follows, addition. A symbol following one of equal value is to be added, and a smaller one between two larger is to be subtracted from their sum. A horizontal line above a letter multiplies its value by 1,000. A modern scientific notation for very high numbers, especially when ending with many ciphers, is to denote them by using ten with an exponent. Thus, 10¹² signifies instead of 1,000,000,000,000; 10⁻⁹, 10⁻⁹ × 261 instead of 2,610,000,000,000,000; 10⁻³ instead of .000,000,001. Compare NUMERATION; ZERO.

—abridged notation (*Geom.*), a mathematical expression denoted by a single letter.—Bow's n., a system of marking or lettering so that the forces and stress-see in architectural members may be indicated in duplicate plans.

Henricke's n.i.—musical n., a system of symbols for musical tones, adapted to relating and to the foundation of musical positions. The most common system is that of the musical staff, in which the pitch of tones is indicated by the lines and spaces on which the notes are placed. See STAFF.

Alphabet notation, the oldest system, consisted of 5 consonants and 2 vowels among the Hindus, and of letters and signs among the Greeks. Diastematic n. begins its history with the introduction of neumes, and is associated with the names of Balbulus (912) and the pseudo-Hucbald (11th century). Up to this time music had been written on one line, the scale degrees being noted by points placed at different distances above the words. A second line was now added to indicate an interval of a fifth above the first line, and two more lines were added by Guido d'Arezzo, whose staff n. of four lines remains the orthodox staff for plain chant. Notation on 4, 5, and 6 lines was in use during the 15th and 16th centuries, and after the invention of printing that on 5 lines became general. See NEUME.—no-ta'-tion-al, a.

nous, 1 nūs or nous; 2 nus or nous, *n.* 1. Mind, as employed in thinking, feeling, or willing; especially, intellect; wit; sense; frequently in a humorous sense. 2. *Anc. Philos.* The higher reason; the immaterial element of the human organism considered as an emanation of the divine principle. The term *nous*, in its technical sense, originated with Anaxagoras, who felt the need of a teleological principle to explain the universe. Diogenes of Apollonia held it to be identical with air and believed that it was able to act upon organic bodies. Plato made it a purely immaterial rational principle, whence emanated all ideas, and identified it with the highest form of intuitive reason, which, as the divine mind, became the Gnostic *Logos*, or unbegotten Son of the Father, whereas with Plato the *logos* was the discursive reason, while the *nous* attained to the ideas. Aristotle, amplifying this thought, regarded the *nous* as the unmoved mover, or God, the transcendent power working to definite ends through the thinking of thought (*noētēs noēseōs*), immanent in man yet imperishable, and assuming in him the double form of the passive intellect (*nous pathētikos*), the source of all his intuitions, and the active intellect (*nous poietikos*) fed from the data of the senses. *De Anima* III, 5. Alexander of Aphrodisias conceived the *nous poietikos* as the active principle of the divine intelligence, a view shared by many of the Arabian philosophers of the middle ages, who interpreted it in a pantheistic sense. The schoolmen retained the main features of the Aristotelian doctrine of intellect, as distinguished from mere sensuous cognition, and as developed by Albertus Magnus and St. Thomas, it is to-day the common doctrine of Catholic philosophers. The tendency of modern philosophy has been toward a negation of Aristotle's views, the old conception of the intellect as a spiritual faculty of the soul being replaced by a more or less decided sensualism. Compare **INTELLECT**.

The *Nous* in turn produces as its image the soul, which exists in it, as itself exists in the One.

Syn. see **FRESH**.—**novel assignment** [U. S.], in common-

law pleading, a new specification of his claim set forth by the plaintiff for more particularity or to cover a wider scope.

nov'el, 1. A fictitious prose narrative, now usually of sufficient length to fill a fair-sized volume, in which characters and actions typical of real life are portrayed through the medium of a plot of more or less intricacy. It forms the third transitional stage in the evolution of imaginative fiction, of which the *epic* was the first and the *romance* the second, differing from the former in that it deals with ordinary characters and actions, and from the latter in that it appeals to the emotions rather than to the fancy and love of the marvelous. The novel is dramatic and may be regarded as a narrative play to the extent that its scenery, manners, surroundings, and mode of speech all belong to the historical period in which its characters are assumed to be living, and also because the personages of the history are brought upon the stage by the author to play their several parts, according to their dispositions and temperaments, in the development of the plot, the action of which is merely assisted by his descriptive and analytical interludes. Technically, the length of a novel is from 10,000 words upward, that of a novelette being from 10,000 to 40,000 words, and of a short story from 1,000 to 10,000 words. See **FICTION**; **ROMANCE**; **REPRESENTATIVE DISCOURSE**. The novel proper may be broadly divided into four classes: (1) the *novel of incident*, including (a) the *n. of adventure*, (b) the *biographical n.*, and (c) the *naval, military, or sporting n.*; (2) the *n. of artifice*, dependent on the cleverness of the action and ingenuity of the plot, embracing (a) the *detective n.*, (b) the *n. of mystery*, (c) the *n. of the unknown*, in which apparently impossible conditions are so treated as to seem actual, (d) the novel whose motif is fear, intrigue, etc.; (3) the *n. of ordinary life*, including (a) the *n. of purpose*, which points a moral or exploits a theory, (b) the *realistic n.*; (4) the *n. of the inevitable*, dealing with the inescapable sequence of cause and effect, including (a) the *problem n.*, which considers problems in human relations or experience, and (b) the *analytical n.* or *n. of character*, which considers events solely in their relation to and their effect upon character.

In the novel of character, the interest is directed to the portrayal of men and women; and the tale . . . is a subordinate consideration. . . . In the novel of incident, the interest is directed to what happens; characters, if there be any at all, come only by the way; the tale . . . is the main thing.

For numbers above and including 1,000,000,000 there are two systems in use — the French, used commonly in the United States, and the English. In the former the above number is read *one billion*; in the latter, *one thousand million*.

In general, in the former the successive names *billion, trillion*, etc., apply to the results obtained by multiplying 1,000,000,000, three, etc., by itself. In the latter they denote successive powers of a million. (See *TABLE* under *NOTATION*.) It should be noted that this difference is one of *naming* (numeration), not of *notation*. The number of things noted by 1,000,000,000 is the same in both systems, but it is called by a different name.

The system of Chaldean numeration was sexagesimal, following a scale of 1, 60, 3600 and 36000. The three superior orders of units were called *sepi* (60), *ner* (3600), and *sur* (36000). *Lexicon of the Beginnings of Hist.* tr. by Mary Lockwood, p. 237, note 3. [S. 1882.]

For the most part the edible nuts are very rich in oil, with only a small percentage of the other carbohydates, starch, sugar, etc., and they also contain a large proportion of nitrogenous constituents. Thus possessing rich nutrient principles in a highly concentrated form, nuts are by themselves rather difficult of digestion.

Plant-nutrition is less complex and more restricted, the absorption of carbon dioxide and mineral constituents being non-essential, as seen in the nutrition of saprophytes.

It has been estimated that in a man weighing 140 pounds the blood is 4 pounds, that of the muscular tissue 27 1/2 pounds, and that in the bones 5 pounds, making a total of 36 1/2 pounds; and that in the course of 18 weeks these 36 1/2 pounds are introduced into the system. *Ure Diet., Nutrition*.

oath. 1 6th; 2 6th, n. 1. A solemn attestation or imprecation in support of a declaration, promise, or vow, by means of an appeal to some personage or object regarded by the person swearing as high and holy.

But in general an Oath includes an imprecation. And hence Puffendorf defines it to be "A religious asseveration by which we renounce the mercy or imprecation the vengeance of Heaven, if we speak not the truth."

WILLIAM FLEMING *Moral Philosophy* p. 294. [*L. M.* 1870.]

2. **Law.** Such an attestation or affirmation of the truth of a statement as renders liable to punishment for perjury one who wilfully thus asserts what is not true. 3. Hence, loosely: (1) An imprecation lightly or humorously used. (2) A simple ejaculation or exclamation, either in the form of a profane adjuration, or containing a corrupted or softened form of an originally profane expression. [*AS. 6th*, oath.]

Syn. adjuration, affidavit, anathema, ban, blaspheming, blasphemy, curse, cursing, deprecation, execration, imprecation, malediction, profane swearing, profanity, reproach, swearing, sworn statement, vow. In the highest sense, as in a court of justice, "an oath is a reverent appeal to God in corroboration of what one says." *A. L. v. Dict.* An affidavit is a sworn statement made in writing in the presence of a competent officer; an adjuration is a solemn appeal to a person in the name of God to speak the truth. An oath is made to man in the name of God; a vow, to God without the intervention, often without the knowledge, of man. In the lower sense, an oath may be mere blasphemous or profane swearing. Anathema, curse, execration, and imprecation are modes of invoking vengeance or retribution from a superhuman power upon the person against whom they are uttered.—**Ant:** benediction, benison, blessing.

The octopus mostly frequents rocky coasts and preys on mollusks and crustaceans. *Octopus vulgaris*, sometimes 9 feet long, is common in the Mediterranean region. *O. punctatus*, found on the Pacific coast of North America, is sometimes 16 feet long. They are naturally timid and inoffensive.
The octopus often takes up its abode within some rocky crevice, and lies safely hidden in the shadow, at the same time simulating the color of its surroundings so that its victims do not perceive their danger until grasped by the suckers of its long muscular arms. This habit of seeking caverns is well known to the Japanese, who capture the octopus for market by simply sinking earthenware jars over night, and then drawing them up in the morning, when some of them are found to be occupied by these repulsive creatures. Despite their generally musky odor, octopi and squids are eaten in France, Italy, and Japan. They are also preyed upon by sea lions and sperm whales.

Feast*, Keats's *On a Grecian Urn*, and Dryden's *Ode on

The origin of opera may be traced to such dramas as the *Agamemnon*, *Antigone*, and *Electra* of Æschylus and Sophocles, in which the choruses were chanted to modulated music. To the development of secular music, which accompanied the glories of the meistersinger, we owe the first comic opera, *Le Gens (le jeu) de Robin et de Marion*, composed by Adam de la Halle, a trouvère, born in 1240. At the close of the 16th century, some Florentine Humanists attempted to revive Greek musical declamation, and their efforts led to the production of the first Italian opera, with Emilio del Cavaliere's *Il Saffo* (1590), Vecchi's *L'Amor pasticcio* (1594), Peri's *Dafne* with libretto by Rinuccini (1597), and his *Euridice*, performed at the marriage of Henri IV. and Marie de Medici (1600). Further impetus was given by the work of Claudio Monteverde, and in 1637 the *Teatro di San Cassiano* was opened at Venice for opera exclusively; France and Germany fell under the influence of Italian opera, and Heinrich Schütz produced a version of *Dafne* in 1627 at Dresden. Opera in England grew out of the masque, and Henry Purcell's *Dido and Æneas* (1689), and *King Arthur* (1691), are true operas. Schools of opera have followed lines identical with the schools of music, and eminent names are alike in each. Compare MUSIC; MUSIC DRAMA.

The libretto of the opera is a peculiar kind of drama entirely in verse and set to music, or partly in verse set to music and partly in prose to be spoken.

J. TRAUBMULL *M'Fingal* can. 1, st. 4. 2. Optical. [C. F. *optique*, < *Gr. optikos*, < *opsomai* (< *ops*, whence also *optas*, seen), shall see.]—*opt'ic-aphasia*, a form of aphasia in which the patient is unable to name an object in sight.—*o. capsule* (*Embryol.*), the cartilaginous case in which the eye of sharks and of the embryonic higher vertebrates is enclosed.—*o. chiasm* (*Anat.*), the commissure that connects the two optic nerves at the base of the brain. See *OPTIC NERVE*.—*o. chiasm*,—*o. entrance*, same as *OPTIC DISK*. It connects the retina with the optic chiasm, and thus forms the first part of the path by which visual impressions reach the cerebral centers. It is present in all vertebrates (*Cranial*) above *Amphioxus*, but in the lowest (hags and lampreys) is more simple than in the higher members of the class; for here each of the pair remains separate, extending directly from the brain to the eye on its side. In all vertebrates above the cyclostomes, on the contrary, the pair join or cross one another at the base of the brain, forming an X (the chiasm or commissure). This junction and the basal parts of the nerves between it and their origin constitute the optic tract. In most fishes (*Teleostei*) the two nerves cross through one another, all the fibers from the right-hand one going straight to the left eye, and vice versa. In other fishes and in all the higher vertebrates, however, some of the fibers do not cross, but continue on to the eye on their own side. The apparent advantage of this arrangement is the securing of unity and coincidence of impression upon the brain from the paired sources of sensation, the eyes. The optic nerves are outgrowths from the embryonic brain, and each gives rise to a retina in each eye as a part of its own structure, the remainder of the eye is formed separately. Centrally each optic nerve is connected through the chiasm and optic tract with the corpora geniculata, the optic thalami, and the anterior pair of corpora quadrigemina.—*o. papillus*, an optic disk. *o. papillat*.—*o. thalamus*, a collection of gray matter at the side of the third ventricle at the base of the brain, connected with the origin of the optic nerve.—*o. tracts*, the portions of the optic nerves between the chiasm and the origins of the portions of the nerves.—*o. tube* [Archaic], a telescope.—*o. vesicles* (*Embryol.*), a pair of outgrowths from the embryonic brain, each of which develops into the retina of an eye. As distinguished from these *primitive* vesicles, the intervals between the retina and lens, in which the vitreous body is developed, are termed *secondary*.

Each stop has its own characteristic quality of tone, and each is capable of being thrown into or out of connection with its keyboard by the movement of a knob operated by the organist. The keyboards are (1) *manuals*, played with the hands, like that of a piano, and arranged in steps, one above another, when there are more than one, and (2) a *pedal* keyboard, played with the feet. A large church organ usually has three partial organs, the *great organ*, the *swell-organ*, and the *choir-organ*; large concert organs have a fourth, called the *solo-organ*, and sometimes a fifth, the *echo-organ*, placed at a distance from the others. Each of the manuals has usually a compass of five octaves, ranging from the C below the tenor C. The *pedal-organ* has a compass commonly of 30 notes, ranging from the C below the lowest manual C. See ORGAN-PIPE and other compounds and phrases below. The mechanical action of the organ is aided by (1) combination or composition pedals or pistons, operating several stops at once, (2) couplers (see ORGAN-COUPLER, below), (3) the swell and *sforzando* pedals, and (4) the tremulant. The supply of compressed air is regulated by bellows, worked in small organs by hand, and in larger by power, generally a hydraulic or electric motor or a gas-engine. The syphon, the bagpipe, and the Chinese *sung* may be regarded as forerunners of the organ. The instrument properly so-called, invented by Ctesibius of Alexandria, was intended for domestic use, and was operated by water-pressure. Until the end of the 9th century A. D. water-organs were almost exclusively employed in Europe and the East, the organs blown by bellows were known as far back as the time of Julian the Apostate. The organ is said to have been used in churches in Spain as early as the middle of the 5th century; it was introduced into England in, if not before, the 8th century and into Germany in the 9th. Among organs of large size are those in Seville Cathedral (110 stops, 5,300 pipes); St. Bavon's cathedral, Haarlem, Holland (60 stops with accessory stops, and 4,083 pipes); Town Hall, Sydney, Australia (128 speaking stops, 14 couplers, 3 balanced swell

or'gan'ic, 1 or'gan'ik; 2 or'gan'ic, a. 1. *Biol.* (1) Of, pertaining to, or of the nature of organisms, or animals and plants; having or consisting of organs. The various living things, or those which have possessed life, compose *The Organic World*. ASA GRAY *Field-Book of Botany* p. 1. [n. a. & co. 1863.] (2) Of, pertaining to, or affecting an organ or organs; as, organic diseases. (3) Serving the purpose of an organ. 2. *Chem.* Containing carbon as an essential ingredient; originally confined to carbon compounds in organisms, but now including carbon compounds of artificial origin.

At first the term *organic* was applied only to compounds whose formation was supposed to be due to vital force, and it was so used until 1828, when Wöhler artificially prepared urea, a distinct product of animal life. The term has continued to expand in its meaning until at present any line of demarcation between organic and inorganic compounds is arbitrary rather than natural.

A useful practical distinction between organic and inorganic substances is afforded by their behaviour when heated. An organic substance is either converted into vapour when moderately heated, or is decomposed into volatile products, generally leaving a residue of charcoal, which burns away when heated in air.

8. [*Rare.*] Resembling the organ or its tones; organ-like. [*< L. organicus*, < *Gr. organikos*, < *organon*, organ.] or'gan'i-cal, SYN.: see RADICAL.—organic analysis, the analysis of a compound containing carbon, hydrogen, and oxygen, and occasionally nitrogen, by oxidizing the compound with oxygen from red-hot cupric oxide, sometimes aided by a current of pure oxygen, so that the hydrogen is oxidized to hydrogen monoxide (H₂O) and the carbon to carbon dioxide (CO₂), while the nitrogen, when present, may be estimated as a gas or in combination with hydrogen as ammonia (NH₃). When sulfur and phosphorus are present, they are oxidized into sulfuric and phosphoric acids and determined as such. If the compound be such a one as starch or sugar, it is thoroughly dried and then weighed in a vessel of platinum or porcelain, called a boat, which is placed in a hard glass (Bohemian) or porcelain tube, the remaining portion of which is packed with cupric oxide. The various parts of the apparatus indicated in the illustration are then connected. The cupric oxide is first made red-hot by the burners of the furnace (7). Then the compound is heated and oxidized by the oxygen from the container (1), after its passage through the purifying-apparatus (2). Further passage of the material through the red-hot cupric oxide insures its complete oxidation. The hydrogen of the compound having thus been converted into hydrogen monoxide (H₂O), it is absorbed in the weighed tube (4) containing calcium chloride, which is reweighed after the combustion, and from its increase the proportion of hydrogen is estimated. The carbon is converted into carbon dioxide (CO₂), which passes to the potash-bulb (5) and its guard-tube (6) containing calcium chloride (previously weighed together), where it is absorbed. On the completion of the operation the oxygen is turned off and a current of purified air drawn or passed through the combustion-tube, as by means of an aspirating-apparatus, when the absorption-apparatus (5 and 6) are weighed, and from the increase the amount of carbon is calculated. The difference between the combined weights of the carbon and hydrogen and the original weight gives the amount of oxygen.—o. chemistry, the branch of chemistry that relates to carbon compounds. See CHEMISTRY, and ORGANIC. 2.—o. description of a curve, description with instruments of a plane curve.—o. disease, a disease that affects some particular organ in its structure, as distinguished from its function.—o. electricity, animal electricity.—o. geometry. *Math.* 1. or'tho-dox, 1 or'tho-doks; 2 or'tho-döks, a. 1. Correct in doctrine; holding the commonly accepted faith; especially, sound in religious doctrine; specif., holding the doctrines of the ecumenical creeds; Trinitarian; as, *orthodox* differently, the Greek Church refusing the epithet to Christians not of its communion, the Roman Catholic Church denying it to Protestants, and Protestants generally claiming it only for believers in Trinitarianism. Thus among New England Congregationalists the Trinitarian parishes are called simply *orthodox* as distinguished from Unitarian. The Quakers for like reason are sometimes divided into *orthodox* and Hicksite. The underlying assumption in all these cases is that there is a standard of faith or belief expressed in determinate phrases or contained in a certain norm of conduct to which the orthodox must assent. But the evidence for the authenticity of the New Testament, to be derived from the Heretical Writers of the first three centuries, is still more important than even that of the orthodox fathers. T. H. HODGINS *Intro. to the Bible* vol. i, p. 85. [l. a. & co. 1872.] 2. The franchise was allowed only to church members, and church members were admitted only on satisfactory proof of the *orthodoxy* of their views and lives. E. E. HALLS *United States* p. 56. Whether the ostriches are a single species or more the habits of the birds are practically the same. The most convenient classification recognizes one species (*Struthio camelus*), with a variety (australly) in South Africa, another (*molybdophanes*) in Somaliland and a third (*massaicus*) from the Masai country in British East Africa. The plumage of the male is black, with white plumes at the end of the wings and tail, which are much esteemed for ornamental purposes. The ostrich can be reared and domesticated on special farms. It is erroneously said to bury its head in the sand when in danger. His (Dryden's) imagination resembled the wings of an ostrich. It enabled him to run, though not to soar. — of all others. When with a superlative stating the results of a comparison, a grammatically censurable form; as, "But *thou* art the greatest man." The fault arises from failure to distinguish the forms appropriately used with the comparative degree from those appropriate with the comparative and the superlative degree. In a comparison by means of a comparative followed by *than*, the thing compared must always be excluded (as by *other* or some like word) from the class of things with which it is compared; as, "The molting-season is a very delicate and interesting period both for birds and bipeds" should be "The molting, etc., for both birds and *other* bipeds," since the omission of *other* implies that birds are not bipeds. But in the case of such a comparison by means of a superlative, the object designated by the superlative must always be included in the class of things with which the comparison is made; not "Washington is the best-known of all *other* modern patriots," but "Washington is the best-known of all modern patriots," since the use of *other* excludes Washington from the class with which he is compared, and makes the form of expression self-contradictory. "This measure of all others ought to have been avoided." By no possibility could this measure be one of all others. See HODGKINS' *Errors in the Use of English* pp. 83-85.

Amphitropous—to the real egg, the name ovule and section. 4. Anatropous (ovule) has been retained for convenience. A portion of the ovary, the *placenta*, is the basis of the ovule's growth. Generally the ovule is a carpellary outgrowth, but sometimes it is formed directly from the apex of the floral axis, as in *Taxus*. A stalk, the *funiculus*, attaches the ovule to the carpel. Between the double integuments (*primine* and *secundine*) is left a narrow channel, the *micropyle*, through which the pollen-tube proceeds to the embryo-sac, within which is the egg awaiting fertilization. The fertilized ovum grows into the embryo, and the complete structure developed from the ovum is termed the *seed*.

owl, n. 1. A predatory nocturnal bird of the coraciiform family *Strigidae*, closely allied to the nightjars.

The owls form a cosmopolitan and highly diversified group, separated on structural grounds into two subfamilies, *Striginae* and *Bubo*. The head is large, the neck short and thick, the bill short, curved, and sharply hooked, the claws long, sharp, and very muscular, the plumage tinted gray and brown. Most of the species see poorly in sunlight, and emerge at dusk to seek their mates and their food, which latter consists of mammals, birds, reptiles, and insects. The American owls feed for the most part on such pests to agriculture as mice and gophers, and hence are aids to the farmer. Some tropical species eat crabs and fish (see *FISH-OWL*). Owls usually breed in natural cavities of trees, or in crevices among rocks, or in old buildings, but frequently repair and occupy old birds' or squirrels' nests, and certain species nest upon or beneath the ground (see *BURROWING OWL*). The eggs are invariably white. The Greeks assigned the little horned owl (see *OWLET*) of southern Europe to Pallas Athena as an emblem of her supernatural wisdom. The common owl of Europe is the *brown* or *tawny owl*. Of North-American owls, prominent species are the circumpolar hawk-owl and snow-owl, the great horned owl (*Bubo virginianus*), differing little from the eagle-owl of the Old World, the great gray owl (*Scotopelia nebulosa*), and the barred owl or cat-owl—all of large size. Among the smaller species are the long-eared owl (*Asio otus*), the short-eared owl (*Asio accipitrinus*), the barn-owl or yellow owl, the mottled or screech-owl, the saw-whet or Acadian owl, and the burrowing and pigmy or elf-owls of the West.

ox-'ide, 1 oks-'id, -id or -aid; 2 oks-'id, -id or -id (XIII), *n.* *Chem.* Any binary compound of oxygen, either with an element or with an organic radical; as, calcium oxide; ethyl oxide.

Oxids, according to their empirical composition, are *mon-*oxides (M₂O and MO, M being any element), *sesquioxides* (M₂O₃), *dioxides* (MO₂), *trioxides* (MO₃), *tetroxides* (MO₄), *pentoxides* (M₂O₅), and *heptoxides* (M₂O₇).

Acidic oxids are those that unite with water to form acids, or combine with basic oxids to form salts, as sulfur trioxide (SO₃), which unites with water (H₂O) to form sulfuric acid, or with barium oxide (BaO) to form barium sulfate. They are sometimes called *anhydrides*. *Basic oxids* are those that unite with acids or acidic oxids to form salts. *Metallic oxids* are those that consist of a metallic element and oxygen, and are for the most part basic. *Neutral*

oxids are those that do not form acids with water, can not be obtained by removing water from acids, and do not form salts by uniting with either basic or acidic oxides or with acids. Peroxids are those that combine with acids to form salts that correspond with oxids containing less oxygen than they themselves do. Thus, hydrogen dioxide (H₂O₂) and barium dioxide (BaO₂) are peroxids. [*< Gr. oxyds, acid; oxyd-, black oxid of iron (Chem.), the magnetic iron oxide, FeO.*]

40 to 50 degrees Fahrenheit. The oysters should be protected from the sunlight by a proper covering in a cool place and kept moist with sea water or brine which is sprinkled over them in such a way as to come in contact with each oyster in the heap. Oysters kept under these conditions often remain in an excellent state for consumption for a week or ten days or even longer. . . . The treating of oysters with fresh water in order to swell them and thus make them appear larger and plumper than they really are is a treatment which is reprehensible in every respect. Not only does it deceive the customer in regard to the size of the oyster but it deprives the oyster of its proper taste and flavor. 'Soaked' oysters quickly lose their flavor. HARVEY W. pan'gen'e-sis, 1 pan'jen'i-sis; 2 pän'jen'e-sis, *n.* *Biol.* 1. Origin from all parts of the body: provisional hypothesis of heredity advanced by Charles Darwin. He assumed that all the cells or units of the body of an organism throw off very minute gemmules or pangens, which circulate through the body and settle down in buds or germ-cells. The gemmules are able to reproduce cells or units similar to those from which they are derived and enable the bud or germ-cell to develop into a complete individual. Some of the gemmules may remain dormant for several generations.

Gemmules are supposed to be thrown off by every unit, not only during the adult state, but during each stage of development of every organism; but not necessarily during the continued existence of the same unit. Lastly, I assume that the gemmules in their dormant state have a mutual affinity for each other, leading to their aggregation into buds or into the sexual elements. Hence, it is not the reproductive organs or buds which generate new organisms, but the units of which each individual is composed. These assumptions constitute the provisional hypothesis which I have called Pangenesis.

pan'the-ism, 1 pan'thī-izm; 2 pan'thē-izm, n. 1. *Philos.* The doctrine that identifies with the One Substance all finite physical and mental existences, as its more or less illusory and transient modes or manifestations; the doctrine which holds that the self-existent and self-developing Universe, conceived of as a whole, is God. Since pantheistic elements and ideas are found in the religious consciousness of man, and with all the greater religions, in their sacred scriptures, *pantheism* has come to be a rather loose designation for several varying doctrines of God and his relations to the world. It contrasts with *atheism* as the positive denial, and with *agnosticism* as the dogmatic doubt, of the existence of God. It opposes that form of *deism* which denies the divine immanence and separates God from the world. Its essential difference from *theism* consists in its doctrine of substance which, in its extreme form, denies that God as personal ethical Spirit transcends the universe, considered in its totality, but, on the contrary, affirms his identity with the universe. In its more *materialistic* form it either deprives the Divine Being of all personal characteristics whatever, or also reduces them to the terms of dream-like and quasi-animal consciousness. In this form it is scarcely, or not at all, distinguishable from materialism. In its more *spiritualistic* form it is apt to deny the true personality of man and reduce all human experience to an illusory and evanescent fragment of the divine reason, the latter term even being employed with an impersonal significance. In all its forms, to speak figuratively, all finite existences, including self-conscious and rational beings, are "lost," "finally merged," or "swallowed up," in God. *Oriental pantheism* is, in general, a doctrine of the fusion and descent of appearance of the universe, as a manifestation of an unknown God; *Occidental p.* tends rather to materialism, or to the virtual denial of God. It (*pantheism*) therefore represents God and nature as eternally and necessarily coexistent.
R. FLINT *Anti-theistic Theories* p. 339. [w. n. 1894.]
In brief, the only pantheism, which is not virtually atheism, differs from the latter in failing to rise to the full-orbed conception of the personality of God.

c, earth's center; o, observer; s, star; p, apparent position of the star on the celestial sphere as seen from the earth's center; p', same as seen from surface. c, zenith; os, angle of parallax. Henry VIII. Act II. sc. 1.

par'al-lél, *a.* 1. *Geom.* (1) Lying in a plane and not meeting no matter how far produced; said of equidistant straight lines.

The lines of an Ionic column were once supposed to be parallel; but it was found that if produced to a sufficient distance above the capital, they at last touch.

A. T. PEARSON *Manu Infinites Proofs* p. 203. [i. n. v.]

(2) Not meeting however far extended: said of planes.

par'al-lél, *n.* 1. A line extending in the same direction with and equidistant at all points from another line.

The introduction of infinity in modern geometry gives its characteristic definition due to Desargues, 1639: *Parallel* is a straight line on a common point at infinity (figurative point). This has the advantage (1) of being freed from the necessity of specifying coplanarity, and (2) hence giving an exact analog for planes. G. B. HALSTEAD *The American* vol. vii. Non-Euclidean Geometry.

Pa-rī-s, *n.* 1. *Gr. Myth.* A son of Priam, King of Troy, by Hecuba, who dreamed that she was to bear a fire-brand. Taking it to be a bad omen, Paris, when born, was exposed on the slopes of Mt. Ida. He there grew up as a shepherd and was appealed to by the three goddesses, Hera, Aphrodite, and Athena, to settle the question of their beauty by awarding to the most beautiful the golden apple of discord. Hera promised him the sovereignty of all Asia; Athena, glory in war; and Aphrodite, the fairest of women as his wife. Paris awarded the apple to Aphrodite and, under her protection, sailed for Greece, whence he carried off Helen, wife of Menelaus, King of Sparta. Her beauty had brought her as suitors all the noblest chiefs of Greece and they resolved to revenge the outrage. Thus the Trojan war began. Paris killed Achilles and died from the wounds he received from Philoctetes. 2. In Shakespeare's *Romeo and Juliet*, a young noble favored by Juliet's father and killed by Romeo.

par-ish, 1 *pār-īsh*; 2 *pār-īsh*, *n.* 1. [*U. S.*] (1) A religious congregation comprising all those who worship together in one church; also, the district in which they live. Roman Catholic parishes are limited either territorially or by the language of the parishioners; as, a Polish *parish*. (2) [*La.*] A civil division of the State, corresponding to a county. (3) Formerly, in some of the Southern colonies, a civil division of a county. (4) In New England, originally, a district (usually a town) under the control of one church and taxed for its support; hence, the people in such a district, either as controlling the temporalities of the church (society), or the district as the field for the Christian work of the church. 2. [*Eng.*] (1) The ecclesiastical district in charge of a rector or vicar. (2) One of the civil districts into which a county is divided for administration of the poor-laws, care of the highways, etc.
In the United Kingdom and some of the colonies, the term *parish* is primarily used in an ecclesiastical sense, but is also understood as covering certain aspects of civil administration or local government. Originally the *parish*, including one or more hamlets, had its church and priest to whom tithes and ecclesiastical dues were paid. In time, primarily for the convenience of administering the poor-laws, and then for other reasons of local government, the civil *parish* was by statute separated from the ecclesiastical, so that the term *parish* has come to have various meanings, such as: **Burial Acts p.**, an area treated as a parish, for the purpose of the Burial Acts, 1852; **district p.**, a civil parish carved out of an original parish; **highway p.**, a district larger or smaller than an original parish, regarded as a unit for keeping the highways in repair; **land-tax p.**, an area separately assessed for taxes; **new or Peel p.**, a parish constituted for the collection and distribution of the poor-rates; **reputed p.**, or **parochial chapelry**, a parish with a parochial chapel in which all parochial rites, such as mar-

riages, baptisms, burials, and the sacraments are administered independently of the mother church. In Scotland, an original parish is known as a **p. quoad omnia**; one that has been made ecclesiastical, a **p. quoad sacra**, and one that is civil only, a **p. quoad civilia**.
The holding of the English noble or land-owner (in 608-600) became the *parish*, and his chaplain the parish priest, as the king's chaplain had become the bishop, and the kingdom his diocese. *Chaucer's Short Hist. Eng. People* p. 60. (in 1375.)
3. *Hist.* A diocese. 4. *Curling*. The ring with the tee in the center. [*< F. paroisse*, *< L. parocia*, *< Gr. paroikia*, *< paroikos*, neighboring, *< para*, beside, + *oikos*, house.] **par-ist**; [*Scot.* or *Obs.*].
— **on the parish** (*Eng.*), dependent on the charity of the parish, or provided for out of the poor-rates. — **parish book**, a parish register. — **p. clerk**. 1. par'li-a-ment, *n.* 1. A meeting or assembly for consultation and deliberation; a legislative body; a national legislature, especially when composed of various estates.

A State legislature . . . is essentially a parliament, though a parliament with limited functions. *U. S. n.* 120. [l. u. & co. 1883.]

2. [P.] The supreme legislature of the United Kingdom of Great Britain and Ireland, composed of the three estates of the realm—the lords spiritual, the lords temporal, and the commons—together with, in a strict legal sense, the sovereign.

The archetype of Parliament is found in the ancient Teutonic system of popular representation in government, perhaps transmitted through the *thing* (assembly of sages) of the Anglo-Saxons. After the Norman conquest (1066) the national assembly was transformed into a selected royal council, dominated by the king; but from time to time its prerogatives were regained, and it was recognized in Magna Carta (1215) as the supreme legislative body of the kingdom. The name *Parliament* was applied to it in the reign of Henry III. (1216). The first assembly of an undoubtedly parliamentary character met at Westminster November 27, 1295. The separation of the two houses into Lords and Commons dates from the middle of the 14th century, the reign of Edward III. The House of Lords consists of the spiritual lords of England and the temporal peers of the United Kingdom, together with the representative Scottish and Irish peers, but does not include about 130 Scottish and Irish peers who hold no imperial title, of whom the latter may be elected to the House of Commons to represent any constituency, outside of Ireland. The House of Lords, while retaining exclusively the powers of justice, shares the power of the House of Commons with respect to legislation, but can not originate money bills; its members, however, can record their protest against any measure they oppose, as when they refused to pass the budget in 1909 before it had been submitted to the country for its approval. The crown now has the privilege of creating a few life peerages to strengthen the legal element in the upper house. The real power of government in the United Kingdom rests in the House of Commons, consisting (1919) of 680 members elected by the people, concentrated in the cabinet whose number varies, but whose members must have the confidence of the House in order to carry on the government. This house alone settles all questions of taxation. The House of Lords usually accepts all measures of the House of Commons having the seal of popular approval; but under the Parliament Act, passed in 1911, it has a suspensory veto for two years only in cases of conflict. The two houses, besides having sovereign jurisdiction in the making and repealing of laws, can regulate or alter the succession to the crown and can also change and establish the state religion of the country. The legal period of duration of a single Parliament since 1716 is seven years, and of the interval which may elapse between the dissolution of one parliament and the summoning of another, three years. It is summoned to assemble, prorogued, and dissolved by the crown.

Charles I. . . made the deliberate attempt to govern England without a Parliament. *Fisher's Information* p. 436. [r.]

3. [P.] The legislature in any of Great Britain's self-governing colonies. 4. [P.] In France, one of several tribunals of justice. The chief of these was the Parliament of Paris, instituted by Philip Augustus in 1190, made the chief court of justice in France by Philip IV., suppressed by Louis XV. in 1771, restored by Louis XVI. in 1774, and suspended by the National Assembly November 3, 1789, which registered royal edicts before they could become law, received appeals from inferior tribunals, and took cognizance of offenses against the crown and its officers.

production of a new individual from a virgin female

without intervention of a male, as in plant-life and

some hymenoptera. In colonial hymenoptera, as bees, the

unfertilized eggs give rise to males only. The production of

a complete adult animal from an unfertilized egg is termed

complete parthenogenesis; when the adults so produced

are females only it is gynogenetic *p.*; isoparthenogenesis

or normal *p.* is that which occurs as a part of the regular

life-history of a species, whereas occasional or tythopar-

thenogenesis is the chance development of unfertilized

eggs produced by an organism whose eggs usually require

fertilization; partial *p.* occurs when unfertilized eggs are

incompletely developed.

Par'the-non, 1 *par'the-non*; 2 *par'the-non*, *n.* [Gr.] The

temple of Athena Parthenos on the Acropolis at Athens,

built under the supervision of Phidias during the adminis-

tration of Pericles, and dedicated 438 B. C. It is composed

of Pentelic marble and built in the purest form of Doric ar-

chitecture. Its length is 227 feet, breadth 101 feet, and

height 65 feet. The interior consists of an oblong chamber,

called the *cella*, surrounded by columns and divided into

two parts of unequal size, the larger called the *naos* and the

smaller *opisthodomus*. The *opisthodomus* was the rear porch,

corresponding to the *pronaos* or front porch. In the

former was placed the chryselephantine statue of the

goddess, by Phidias; the latter was probably used as a treas-

ury. The Parthenon in its original beauty was bright with

colors and gilding and was adorned with sculptures that are

still considered masterpieces of ancient art. The pediments at either end of the building were filled with colossal groups of statuary, the subject represented upon the eastern pediment, the principal entrance, being the birth of Athena, and that on the western pediment her contest with Poseidon for the supremacy of Attica. The metopes in the frieze of the entablature contained higher relief sculptures representing the battle of the Centaurs and Lapithae and other subjects from Attic mythology; the frieze running round the top of the external walls of the *cella* was adorned with sculptures in very low relief, representing the Panathenaic procession. In 1687 great damage was done to the Parthenon and its sculptures by the explosion of a bomb during the siege of Athens by the Venetians. In 1811 Lord Elgin obtained possession of a number of the principal sculptures from the temple; these were purchased by the British nation in 1816 and placed in the British Museum, London. See illus. below. [*< Gr. Parthenon*, *< parthenos*, virgin.]

(King's College Chapel, University of Cambridge.)

Pointed architecture in England from toward the end of the 14th century, the tendency toward this type can be traced further back. It is characterized mainly by a mechanical accentuation of the vertical lines; by tracery in the general form of rectangular tracings with rather small openings, often filling large windows; by markedly flat keel-shaped arches, very commonly framed in square panels; and by prismatic turrets with domical summits ornamented, like the pinnacles of the style, with crockets and finials of cabbage form or other barbarous character. The style is noted for the elaborate fan tracery of much of its vaulting, and has produced some very noble interiors, as those of Henry VII.'s Chapel in Westminster Abbey and of King's College Chapel, Cambridge. It was developed from the late or flowing Geometrical style, and passed into the Tudor and the Jacobean. See chart of ARCHITECTURE, and POINTED ARCHITECTURE, under ARCHITECTURE.—**per**/'pen-die-'u-lar-'i-ty, *n.*—**per**/'pen-die-'u-lar-'i-ty, *adv.*

Perspiration is continual. When evaporated as fast as exhaled, it is insensible perspiration; when it accumulates so as to form drops, it is sensible perspiration or sweat. It consists of part of the watery constituents of the blood, and is composed of chlorid of sodium, acetic acid, traces of oxid of iron, lactic acid, and a certain amount of urea; it has been estimated that the quantity exuded daily from the human skin is 1½ lb., but after violent exercise or during periods of intense mental emotion it is much greater. The sweat-glands of the entire human body number more than two millions, varying from 400 per square inch on the back to about 2,700 on the palms of the hands and the soles of the feet. They are usually situated in the subcutaneous areolar tissue, and discharge through slender tortuous tubes at the so-called pores of the skin. The function of perspiration is connected with that of respiration and of excretion by the kidneys; it has been found that the greater the evaporation by the lungs the smaller the perspiration, as in dogs and some other mammals. [*< F. persuader*, *< L. persuado*, *< per*, through, + *suado*, advise.]

Syn.: all ire, bring over, coax, convince, dispose, entice, impel, incite, incline, induce, influence, lead, move, prevail on or upon, urge, win over. Of these words *convince* alone has no direct reference to moving the will, denoting an effect upon the understanding only; one may be *convinced* of his duty without doing it, or he may be *convinced* of truth that has no manifest connection with duty or action, as of a mathematical proposition. To *persuade* is to bring the will of another to a desired decision by some influence exerted upon it short of compulsion, one may be *convinced* that the earth is round; he may be *persuaded* to travel around it; but persuasion is so largely dependent upon conviction that it is commonly held to be the orator's work first to *convince* in order that he may *persuade*. *Conviction* is a lighter word than *persuade*, seeking the same end by shadowy methods, largely by appeal to personal feeling, with or without success; at a child *coaxes* a parent to buy him a toy. One may be *brought over*, *induced*, or *prevailed upon* by means not properly included in persuasion, as by bribery or intimidation; he is *won over* chiefly by personal influence. 2. Considered geologically rocks are **sedimentary**, **metamorphic**, or **igneous**; igneous rocks which have solidified at or near the surface are termed **volcanic**, while those which have undergone cooling in the recesses of the earth are **plutonic** or **abyssal**. See *IGNEOUS*, *METAMORPHIC*; *SEDIMENTARY*. Rocks of one neighborhood or center of eruption have been found to present genetic relations, or common mineral or chemical characteristics or consanguinities, whence the regions so distinguished are termed **petrographical provinces**. Recent developments of physical chemistry point to a classification of igneous rocks on this genetic basis; such a system was outlined by Roth (1891) and in Rosenbusch's classical work (1877-1908), dealing mainly with a qualitative classification, and recognizing quantitative proportions only in a general way. In 1901 Becker suggested a classification based on eutectics, and Vogt, in 1905, on the course of magmatic differentiation. It is, however, the general belief that any natural classification to be acceptable must be a mineralogical and not a chemical one. The two great primary divisions of igneous rocks are the **Atlantic branch**, rich in alkalis, feldspars, micropertitite and cryptoperthitic intergrowths, feldspathoids, quartz, mica, and garnets, and including alkali-granites, syenites, essentites, peritites, etc.; and the **Pacific b.**, rich in soda-lime feldspars and pyroxenes, while mica is not common. A computation made by Clarke in 1911 shows the mean composition of the accessible parts of the earth's crust to be SiO_2 , 59.85; Al_2O_3 , 14.87; Fe_2O_3 , 2.63; FeO , 3.35; MgO , 3.77; CaO , 4.81; Na_2O , 3.29; K_2O , 3.02; H_2O , 2.05; TiO_2 , .73, other 1.63. It has been found that the most abundant rocks are those containing approximately 52.5 per cent. of silica and that rocks rich in silica are poor in magnesia, and conversely.

In 1903 there appeared a *Quantitative Classification of*

Igneous Rocks, by Cross, Iddings, Peirsons, and Washington, which its authors announced as a "chemico-mineralogical system based on its own principles . . . and demanding a new nomenclature." These principles are not generally accepted by geologists, who hold that petrology is an inductive, not a deductive, science. The classification is founded upon a nomenclature system of nomenclature of rock-formation based on the amounts of light and dark materials, styled as *sulfic* and *ferric* minerals, present, and which are shown by the prefixes *pet-* and *fer-*, meaning respectively, *excessively abundant* and *dominant*; thus, *pet-sulfic* is said to be in greater proportion than 7:1; *fer-sulfic*, said to be between 7:1 and 5:3; *sulfic-ferric*, equally said to be *ferric*; *fer-ferric*, *per-ferric*; in the same way, the suffix *-o* is added to denote the mesoprosopie presence of a mineral, and *-i* to denote its microscopic presence; thus, *crano* is mesoprosopically granitic, and *gran* microscopically granitic. The practice of naming a rock type from its original locality with a uniform termination is also employed; thus Vesuvian lava belongs to the *vesuvian* class, order *italar*, rang *Vulturne*, subrang *Bracciano*.

Crude petroleum is a dark-brown to greenish liquid, which by refining yields kerosene, naphthalene, gasoline, naphtha, benzol, kerosene, lubricating-oil, and paraffin. It is found in various parts of the world, as in the United States, southern Russia, and India. The first named country, since the development of the industry (dating from 1859), chiefly controls the markets of the world. The output from Russia, the less refined, is also very considerable. Nearly all geologists believe that petroleum has been formed by decomposition of organic matter either of animal or of vegetable origin. But the Russian chemist Mendeleef holds that petroleum was formed in the depths of the earth by chemical action of water on heated metallic carbides. The perpetual fires at pagan shrines are believed to have been springs of petroleum ignited at the surface. Piny describes its use in lamps. Genoa was lighted by petroleum from the wells of Amiano, and the American Indians collected petroleum, which they sold under the name of *Seneca oil* for various purposes, especially as a remedy for rheumatism. American petroleum in a crude form has a specific gravity of 0.8 to 0.92, and distills over from 30°-360°; among its products by fractional distillation are: *p. ether* or *naphtha* (sp. gr. 0.665-0.67; distills about 50°-60°; consists of pentane and hexane); *p. benzol* or *p. spirit* (sp. gr. 0.68-0.72; distills at 70°-90°; consists of hexane and heptane); *ligroin* (sp. gr. 0.71-0.73; boils from 90°-120°; consists of heptane and octane); *refined p. or kerosene* (sp. gr. 0.78-0.82; boils from 150°-300°). *Caucasian p.* has a higher specific gravity than American and distills at 150°. Philosophy: { First principles in themselves } Metaphysics as Ontology

{ First principles of knowledge } Epistemology or Gnosiology

{ First principles of being } Anthropological Philosophy

{ } Cosmological Philosophy

{ } Ultimate Philosophy

The object-matter of philosophy may be distinguished as God, or nature, or man. . . . But underlying all our inquiries into any of these departments, there is a first philosophy, which seeks to ascertain the grounds or principles of knowledge, and the causes of all things. Hence philosophy has been defined to be the science of causes and principles. . . . It is the investigation of these principles on which all knowledge and all being ultimately rest.

K. F. VORH. *Philos.* p. 383. [n. & co.]

It is true, that a little philosophy inclineth man's mind to atheism; but depth in philosophy bringeth men's minds about to religion. BACON *Works*, *Essays* in vol. 1, p. 273. [n. & n. 1871.]

Phosphorus is obtained from the animal kingdom, as from bones and urine, and from the mineral kingdom, as from apatite and vivianite. It is used in medicine in cases of nervous exhaustion. Its most important compounds are the phosphates, which form valuable fertilizers. See PHOSPHATE. It forms compounds with hydrogen and the halogens, combines with most metals, and is a powerful reducing agent. In cases of poisoning by phosphorus the antidotes are hydrogen peroxide, lime-water, or lemon-salts. It exists in the following allotropic modifications: (1) **ordinary**, white, or yellow phosphorus, the usual form of phosphorus (see def. 1), which is obtained by heating bone-ash with sulfuric acid, carbon (and sometimes sand), and condensing the volatilized material under water. It is very poisonous and is used extensively in making ordinary matches, rat and vermin poisons, etc. When solidified slowly it is transparent, but when cooled rapidly it forms a waxy translucent mass. It is brittle at low temperatures, but at ordinary temperatures can be cut with a knife. It is almost insoluble in water, but slightly in oil of turpentine, and is a non-conductor of electricity. (2) **amorphous** or **red p.**, a reddish-brown non-toxic form obtained by heating common phosphorus to about 450° Fahr. in air-tight vessels; largely used for safety matches. It does not take fire until heated to 260° C., conducts electricity, and forms red solutions with alcoholic potash. ho'tog-ra-phy, *l* *fo'tog-ra-fi*; 2 *fo'tog-ra-fi-y*, *n.* The **to'tog-ra-fi-y**, *process* of forming and fixing an image of an object or objects by the chemical action of light, usually on a film containing salts sensitive to light, and spread on a plate of metal or glass or on paper or celluloid; also, the art or business of producing such images and of reproducing them by heliocal printing.

The sensitive salts usually employed are silver nitrate and various salts of silver and of potassium. When light is allowed to reach the sensitized surface in a camera, otherwise, a chemical change takes place in the salts, which is greater in the more highly illuminated portions. If this change produces an image with normal lights and shades, it is called a *positive* or print; if the lights and shades are reversed, it is a *negative*. In ordinary photography a *latent image* is first produced on a transparent plate or film; but it is invisible until *developed*, or washed in a liquid, as pyrogallie acid combined with an alkali, that forms an opaque image, the *development* process. This was effected by the use of very small equidistant intervals, and in astronomy (1) by contact stars, etc., otherwise invisible through the telescope, (2) to note the receding or approaching movement of heavenly bodies along the line of sight, and (3) to prepare celestial charts, etc. In the development of photography the first important step was the observation that certain salts were sensitive to light. In 1777 Carl Scheele, a Swedish chemist, by discovering that silver chlorid was blackened quickest by the violet rays of the solar spectrum, proved that light-rays are not all alike chemically active. Johann Ritter, of Berlin, demonstrated the existence of non-visible chemically active rays beyond the violet rays of the spectrum. Thomas Wedgwood and H. Davy were the first to produce pictures on a sensitized surface in 1802, but these were not permanent. Joseph Niepce, of Châlons-sur-Saône, succeeded in producing permanent pictures in 1814; this process he designated heliography. Louis Daguerre joined Niepce in partnership in 1829, and in Jan., 1839, announced the discovery of the daguerreotype, which was introduced into the United States later in that year. In 1840 Prof. John William Draper, of New York University, took the first portraits of human beings by an improvement on the heliographic process. This was effected by (1) Fox Talbot's calotype process in 1841; (2) by Scott Archer's wet collodion process in 1851—widely used for fully a quarter of a century; (3) by Dr. Maddox's gelatino-bromid process in 1851, improved by Kennett in 1873 and by Charles Bennett in 1878. Most photometers serve for the comparison of two lights, generally by observing relative distances at which they produce equal illumination or equal effects of some other kind. The effects whose equality is to be observed may be the depth of shade of the two shadows of the same object cast by the lights (*Bunford's photometer*); the shade of a translucent spot transmitting light from one source, and that of the adjacent surface reflecting it from the other (*Bunsen's photometer*); the darkening of sensitized paper (actinic or chemical photometer); or the variations of resistance in a selenium cell, proper time for exposure being determined by the reading in the center. The figures are obtained by previous experiment.

The upper end is placed toward the ground glass of camera. Has a focusing lens, and the slide, which is fitted with glasses of varying translucence, is shifted until a good effect is obtained, when the resistance in a selenium cell, proper time for exposure is indicated in the center. The figures are obtained by previous experiment.

pi-an-o'-fo-rt'e, 1 pi-an-o'-fört' or pi-an'o'-fört'; 2 pi-an'o'-fört'e or pi-an'o'-fört' (XIII), n. A percussive stringed musical instrument, a later and improved form of the harp, harpsichord, and clavicord, in which sounds are produced by hammers, set in motion by keys and a connected keyboard, striking on wire strings.

The essential parts of a pianoforte are: (1) the *frame*, now usually of cast iron, to resist the tension, equal to several tons, of the tightly stretched strings; (2) the *sounding-board*, by which the sonorosity is increased and the quality of the tone improved; (3) the *action*, comprising the mechanism connecting the wires and keyboard (see PIANO-ACTION); (4) the *case* (see PIANO-CASE); (5) the *vetres* or strings, graduated as to length and thickness to produce the desired variations in tone; (6) the *key-board* (see KEYBOARD). The volume of tone is regulated by means of dampers to the wires, operated by pedals. The compass of the pianoforte varies from 5 (formerly) to 7¼ octaves (88 notes). The pianoforte, based upon the dulcimer, was invented by Bartolomeo Cristofori in 1709. Two instruments made by him fortunately remain, one being exhibited in the Metropolitan Museum of Art, New York, and the other at Florence. The invention has been attributed in England to Father Wood, who in 1711 made a pianoforte, and in Germany to Christoph Gottlieb Schroter, who in 1717 made a model of a pianoforte which was approved by Frederick the Great. See *KEYBOARD*. — **PI-A-N-O, adv. & forte** (< *L. fortis*).
